Purification & measurement

Basic equations for
mass determination

$$f_c = \frac{1}{2\pi} \cdot \frac{q}{m} \cdot B$$

$$\frac{f_{c,\text{ref}}}{f_c} = \frac{m - m_e}{m_{\text{ref}} - m_e}$$

Routinely $M/\Delta M \sim 10^5$
Space charge limit $\sim 10^5$
Good/Bad ~ 10000

Routinely few keV
If required few tens of eV ($\delta m/m < 1 \cdot 10^{-8}$)

The β feeding probability of ^{102}Ru , ^{103}Ru , ^{107}Te , ^{108}Mo , and ^{108}Nb nuclei, which are important contributors to the decay heat in nuclear reactors, has been measured using the total absorption technique. We have coupled for the first time a total absorption spectrometer to a Penning trap in order to obtain sources of very high isobaric purity. Our results solve a significant part of a long-standing discrepancy in the γ component of the decay heat for ^{239}Pu in the 4–3000-s range.

the branching ratio, and the decay Q value of the superallowed β emitter ^{42}Ti were measured in a reactor at the JYFLTRAP facility of the Accelerator Laboratory of the University of Jyväskylä. At $T = 1$ s nucleus for which high-precision measurements of these quantities have been tried, $\beta = 208.14 \pm 0.45$ ms and the Q value ($Q_{\beta} = 7016.8(25)$ keV) are close to or reach the \pm of about 0.1%. The branching ratio for the superallowed decay branch [$\text{BR} = 47.7(12)\%$], a β -half-life measurement, does not reach the necessary precision yet. Nonetheless, these results examine the experimental f_1 value and the corrected f_1 value to be $3114(79)$ and $3122(79)$ s,

UNIVERSITY OF JYVÄSKYLÄ

Summary

YVÄSKYLÄ

PT mass measurements have contributed to:

- Better understanding of the binding of exotic nuclei
- Nuclear structure information
 - Shell evolution, shape changes, new regions of deformation, pairing
 - Single-particle energies
- CVC hypothesis and the unitarity of CKM
- Rare decays (Xth-forbidden beta decays, $\beta\beta$, ECEC,)
- Nuclear astrophysics
- Applications, etc

Trap-assisted spectroscopy

- has improved the spectroscopic sensitivity
- Improved the quality of the data

Outlook

- Complementary: rings, MR-TOF, ...
- Laser techniques
- Facility upgrades
